

The foundation

- `index.html` — the single HTML page the whole app lives in. React fills it in.
- `vite.config.js` — tells Vite (your build tool) to use React. You won't touch this.
- `package.json` — the project's "shopping list" of libraries it needs.
- `src/index.css` — all the colors, fonts, and reusable button/card styles for the whole site. If Meghan wants to change the color scheme or typography, this is the file.

Routing & startup

- `src/main.jsx` — the app's entry point. It defines all the URL routes, like "when someone goes to `/wardrobe`, show `WardrobePage`." Also wraps everything in the auth system.

Authentication

- `src/context/AuthContext.jsx` — manages whether a user is logged in or not, globally. Any page can ask "is someone signed in?" and get an answer from here.

The pages (what the user actually sees)

- `LandingPage.jsx` — the public homepage with the hero section and features. Visible before login.
- `AuthPage.jsx` — the sign in / sign up page with a tab switcher between the two.
- `WardrobePage.jsx` — the main closet view. Shows all your clothing items in a grid with search and category/color filters.
- `AddItemPage.jsx` — the form to add a new clothing item. Has the drag-and-drop photo upload, description text box, and dropdowns for category, color, style, and season.
- `OutfitsPage.jsx` — the outfit suggestions page. Pulls the weather automatically, lets you filter by style, and shows generated outfit combinations.
- `SavedOutfitsPage.jsx` — a grid of outfits you've bookmarked from the suggestions page.
- `ProfilePage.jsx` — shows your wardrobe stats and lets you save style preferences.

The components (reusable UI pieces used inside pages)

- `Navbar.jsx` — the top navigation bar with the ThreadTheory logo and links.
- `ClothingCard.jsx` — the individual card for one clothing item shown in the wardrobe grid.
- `OutfitCard.jsx` — the card showing one outfit combination, with a strip of item photos and a save button.

The logic

- `src/lib/supabase.js` — all the database calls in one place. Functions like "get all my clothes" or "save this outfit." Teresa will add to this file as she builds the backend.
- `src/hooks/useWeather.js` — fetches the current weather using your location. Feeds temperature and conditions into the outfit suggestions.
- `src/utils/outfitEngine.js` — the brain of outfit recommendations. Takes your wardrobe items and figures out what goes together based on color compatibility, season, and style. This is the file that gets upgraded when the AI layer comes in.

For Teresa specifically

- `supabase_schema.sql` — the database setup script she runs once to create all the tables.
- `.env.example` — a template showing what secret keys need to be filled in to connect to the database.
